ANUJ6180 SERIES 405 nm Type

Bonding resin or glass of poor UV transmission with 405 nm wavelength

Launch of new 405 nm type for broader UV curing applications

» High-output head
ANUJ6189

» Standard type
ANUJ6187

Features of the 405 nm wavelength type

- Feature 1 High light transmission for resins such as polycarbonates and PEN that absorb UV
- Feature 2 High light transmission for UV cut coatings such as on smartphone lenses and imaging device protective glasses
- Feature 3 Low influence on workpieces easily damaged by UV light
- Feature 4 Further improved deep curing of resins curable with UV and visible light

» Resin light transmittance

■ Light transmittance with our LED-UV wavelength (transparent plate thickness: 2 mm 0.079 in, measured example)

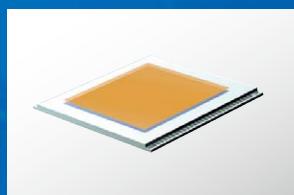

| Wavelength Material | 365 nm | 385 nm | 405 nm |
|------------------------|---------|--------|--------|
| Polycarbonate | 0.004 % | 23.6 % | 83.2 % |

Since light transmittance of a 405 nm wavelength is high for polycarbonate resin, curing of UV and visible light curing adhesive is possible even for this type of transparent resin.

^{a)}The values were measured using a UV illuminometer with Ø1 mm Ø0.039 in sensor hole when the high-output heads were fixed to the attachment, the ambient temperature was maintained at 25 °C 77 °F by the UJ30 / UJ35, and they were turned on with 100 % output (initial value: based on Panasonic's reference measurement method). Since the LED elements show illumination intensity fluctuations, the actual UV intensity may be more than 20 % higher.

^{b)}The value is not a guaranteed value.

^{c)}It is recommended that protective glass ANUJ6430 be used to protect the head-side lens from contamination when the head is used without a lens.
