ULTRA HIGH SPEED VISION SYSTEM IMAGECHECKER PV200 SERIES

COMPACT & HIGH SPEC

ULTRA HIGH SPEED VISION SYSTEM IMAGECHECKER PV200 SERIES

Improved inspection reliability while reducing engineering time

Image processing with impressive accuracy and performance can now be achieved while requiring a surprisingly low implementation and programming time. The new ideal machine is a color/grey combination type.

Hardware

Color and grey images can be simultaneously captured for inspection.

In addition, the "3+1" Quad processor provides ultra-high speed parallel processing, significantly reducing the inspection time.

Features are condensed into the ultra-compact body guaranteeing outstanding usability.

• Quad processor, DSP processing & Pipeline processing

"3 + 1" Quad processor for high speed processing

Consists of a processor exclusively for image capture and transfer, a high-speed RISC-CPU. image-processing DSP, and a processor exclusively for display processing

- Pipeline processing by the Quad processor enables concurrent operation of the image capture process and inspection process.
- Ease of operation is increased, because data R (read) / W (write) (see page 10) and display layout switching operations are possible in the RUN mode.
- DSP processing: High-speed DSP is a processor dedicated for realtime image and grey pre-process filtering.
- High reliability, fan-less, standalone hardware

1st inspection	Image capturing	Inspection / Calculation	Display		
2nd inspection		Image capturing	Inspection Calculation		
3rd inspection			Image captur	ection / ulation	Display

With pipeline (parallel) processing, image capturing and inspection can execute at the same time.

Two cameras, including a combination of color and grey cameras, can be simultaneously connected.

High definition color and grey cameras can be simultaneously connected. Inspections with color and grey images can be conducted concurrently.

Color images clearly show red bad marks, which are difficult to detect with grey images.

O Color / Grey combination inspection system

Grey conversion

Highly flexible grey conversion is possible, because each coefficient can be freely specified for each RGB value of a color image.

• Camera selections

116.5 mm

DIN-rail

Seven types of cameras, including a 4M grey camera, are available with the system.

148 mm 5.83 in

0.3M compact camera has been added to the product line-up. The body is approximately 20 mm 0.79 in more compact lengthwise compared to previous 0.3M grey cameras.

- *1: The main body firmware Ver.1.50 or later is required. Software can be downloaded from our website
- *2: A dedicated cable is required for connecting.
 *3: The 4M camera cannot be used in combination with another type of camera.

Color window

The maximum, minimum, average, and deviation of RGB values can be obtained. Results can be used for numerical calculations and outputted externally.

Color extraction

Colors in different color phases can be simultaneously extracted and inspected by using one inspection checker.

Purple and red orange is extracted.

Branch execution/Designated execution

The inspections can be quickly changed to meet multiple product types or various conditions

Branch execution

Up to nine branches can be set to choose an inspection to be executed depending on the test results.

Designated execution

After trigger signal is applied, up to ten different inspections can be executed immediately. This minimizes the time spent on switching

Inspection result of each block is stored until the next execution.

A dedicated application can be created by controlling the block execution timing externally.

One work is moved and inspected numerous times then given a total judgment (inspection of target using split captures in order to obtain necessary resolution).

Total judgment result output with last block

Block 0 (Inspection of area on furthest left)

Block 1 (Inspection of next area)

Block 3 (Inspection of last area and total judgment)

Imaging conditions are changed, work is inspected numerous times, and total judgment is made (lighting of light source is controlled by a PLC)

Simple alignment

Result of Block 0 is used to inspect at Block 1.

Block 0 (Position adjustment of work) Block 1 (External inspection)

Block 0 (Target position registered)

Inspections of a variety of points of a variety of product types

- Data for up to 256 types can be saved in the built-in memory alone, and 25,600 types with an SD memory card inserted.
- Maximum registrable number of checkers: 1,000 checkers / type

	Line Binary window		Grey window	Binary edge	Grey edge	
Checker types	Feature extraction	Smart matching	Contour matching	Flaw detection	Color window	
туроз	Three connectors (b	oinary window, grey wind	Smart edge (circles) / (line)		

■ Maximum registrable number of templates: 2,000 templates

A total of 15 types

- Maximum available number of numerical calculation formulas: 1,000 formulas / type
 - A variety of operators for numerical calculation are available: Four fundamental operations (+, -, x, ÷), bracket operation, trigonometric function (14 types), comparison function (6 types), mathematical function (15 types), geometric function (18 types), and statistical function (18 types)
- Execution blocks: 10 blocks / type
- Position adjustment: 1,000 checkers / type, Area adjustment: 1,000 checkers / type

Preprocessing

• Grey conversion / Color extraction

• Grey conversion: Max. 16 groups/camera

The conversion coefficients are set for the color image RGB greyscale value and the image is converted to grey. Each RGB coefficient can be set freely (-1,000 to +1,000). This makes it difficult for the inspection to be affected by color changes, such as by the removal of low saturation (low coloration) or non-color parts and by target color enhancement, caused by lighting fluctuations.

• Color extraction: Max. 128 colors/type (one camera, expansion mode)

Utilizing the parameters H (Hue), S (Saturation) and V (Value), which resemble the way humans perceive differences in color, multiple colors (max. 128 colors) can be extracted simultaneously.

O Grey preprocess filters

21 types of grey preprocess filters are available. Reliable inspections are possible even under non-uniform lighting conditions or in the case of images with noise.

Preprocess filters: 21 types
 Preprocess groups: Max. 16 groups/camera
 Preprocess steps: Max. 10 steps/group

Main purpose	Filter name				
Flaw detection	•Tophat •Dynamic	•Grey difference			
Noise removal	DilationErosion	 Erosion → Dilation Dilation → Erosion 			
Image adjustment	•Rotation •Reflect				

	Main purpose	Filter name
	Contour enhancement	•Sobel •Laplacian •Edge extraction Y •Prewitt •Edge extraction X •Sharpen
•	Blurring	Median Smoothing
	Contrast enhancement	•Auto correction •Grey cut •Area averaging •Correction settings

Checker Functions

Smart edge (Circle)/(Line)

Complicated inspection processes can be easily performed with highly accurate measurements.

A function for accurate approximation of circles/lines

This function detects a maximum of 3,000 edge points for a line and 3,600 for a circle in one area, dramatically improving the accuracy of the dimension and position measurements.

Operation principle

- 1. A Grey edge scanning area is created, and edge points in the area are searched to detect the contour of the object.
- 2. Virtual circles and approximate straight lines can be identified with a high degree of accuracy based on the target edge points
- 3. Pass (OK) /fail (NG) evaluations are made based on the measured values (radius, diameter, and width), deviations, circularity, straightness, and the number of edges outside the area.

Smart edge (circle) setting example

One cell can have a minimum width of one pixel (linear scanning), and a maximum of 3,600 cells can be set per 0.1°.

The center of the virtual circle, radius, diameter, circularity, and ring width can be measured.

The center and radius of the corner are measured.

Smart edge (line) setting example

* + *

The influence of surface imperfections is eliminated to accurately detect the target straight line by approximation.

Imperfections along a target sample can be analyzed for maximum and minimum values.

A maximum of 3,000 cells can be set.

• Geometry calculation

Virtual circleApproximatestraight lineIntersection of two lines

Distances, intersections, and median lines can be detected.

This function detects the distance between two points, the intersection of two lines, the median line of two lines, the perpendicular distance, and an approximate ellipse. In combination with Smart edge (circle) / (line), this function recognizes the object as a geometric figure, allowing the coordinates, distances, dimensions, and angles to be obtained without preparing calculation formulas.

Checker Functions

By using the PV200 series matching function, highly accurate detection is possible using two means of matching that take into account the characteristics of the target object and the process environment.

Smart matching

Pattern search

Through means of a unique normalization process, stable detection can be achieved with reduced influence from grey fluctuations.

Detects even with low-contrast images

Detects even with negative images

Selection possible among multiple templates

A high-precision inspection is possible by searching a maximum of 64 templates in the same search area to detect a result with the highest correlation.

Extraction of deviating portion using pattern difference

Based on the position information obtained by the matching function, the registered object and detected object are overlapped and compared on a pixel-by-pixel basis. Any pixels with a difference in brightness over a certain level are detected. The area value of such pixels can then be used to make pass/fail evaluations.

Contour matching

Contour search

A template is created from the contour information (object) obtained from the grey change points (edge points), which means stable detection can be achieved without being influenced by the object shape or changes to the background.

Detects even if background changes.

Even if all of detected target object is registered, detection will be stable regardless of the state of the background.

Detects even if target object is hidden

Stable detection is possible even if part of the object being detected is deficient.

Detects even if the magnification changes (±10 % max.)

The same template can be used for detection even if in processes where the distance between the work and the camera changes.

Stable detection is possible even if the part of the object being detected changed due to a limitation in the lighting or

Detects even with noise

on the target object

inspection process

Common template

- When a common template is used, the information of all checkers that use the same template will be updated with the switch of one template. Compared to the setting of templates individually, time is saved by reducing repetitious work and operational mistakes are prevented.
- · Also, since it is not necessary to register the same template more than once, space for holding templates on the PV200 series can be saved. Images registered as common templates can be used for

both smart matching and contour matching.

This function is ideal for critical appearance inspections, such as scratches, stains, chipped edges, burrs, and other flaws in objects The inspection is carried out by comparing a target's greyscale image with neighboring parts, which helps in the detection of minor scratches, stains, and chips.

Connector checker

Setup for connector inspection has been burdensome up to now. Now inspection can be accomplished by creating one area. This enables a great man-hour reduction.

Inspection example

(Pin coplanarity inspection)

This function detects raised

pins. In the same way as the

pin pitch inspection, setting

simply adjusts the position

using one checker and then

inputting the number of pins.

Pin pitch inspection

This function measures the distance between the edges of each pair of adjacent pins and evaluates the results based on the preset upper and lower limits. Data of the "start point", "end point", and "number of pins" should be

(Inside pin gap inspection)

This function inspects the gap between facing ends of pins. Simply input the number of pins. The upper and lower limits of the gap can be set.

Coordinate calibration

Setting and calculation is possible, linking the camera image with the actual dimensions.

Link two images

Global coordinates between two cameras are generated and both results are quoted to enable direct calculation.

Calculation is possible mixing the separate detected data by two

Dynamic calibration

Conveyance differences arising during stage and index conveyance are adjusted each time to enable stable measuring of the work dimensions.

Interface

Operation screen

The PV200 series has been designed to simplify implementation in both pre-production and post-production.

(Unit conversion axes)

X and Y axes indicate the scale converted into the actual dimensions. (Separately settable for each camera)

Data R (Read) / W (Write) function

Program modifications can be quickly made in the RUN mode without replacing the program or switching to the setting screen. This is useful in cases where changes to the inspection area and pre-processing parameters must be made after the program has been finalized.

[Modification examples]

Splash screen

The splash (startup) screen can be changed to an original screen, such as a screen suitable for the user's equipment or a screen including a brand logo. (A bitmap with a maximum size of 640 x 480 pixels)

Operation customization by external signal

The PV200 series is equipped with a total of five points for ASSIGN and EXTRA signals, which allow you to customize the allocations of tasks, such as layout switching, image data output and screenshot printing.

Customizable Display

■ Character / Figure drawing

A function for drawing text (multi-lingual), measured values, cross marks, arrow marks (dimension lines), rectangles, and ellipses. This function allows drawn items to be displayed following the calculation results or detected positions. It is also possible to specify the character size, fill regions and switch the drawn item colors or turn on/off the display of the items according to the pass/fail check results.

■ Marker function

A straight line, rectangle, circle, ellipse, and cross line can be displayed at any position. The display position can be specified by using external signal.

■ Layout

The VGA screen (640 x 480 pixels) can display two images and two pages of the Data R/W screen. Lavouts can be customized and up to 16 patterns can be registered. They can be switched in accordance with the situation using either the keypad or external signals.

Select menu

By registering to the menu list any item you prefer from the items in the setup screen, you become able to perform operations directly, verify settings, and make changes.

- Improve operability by registering to the menu those functions you use a lot.
- · Prevent operation mistakes by registering to the menu those functions that are okay to change.

Checker parameter registration

Only the set value and result are displayed when a checker parameter is chosen. Parameters other than those items chosen are not displayed.

Number of registrations: max. 50 pages/product type (16 items/page)

Password protection

Setting a password prevents the careless switching to the setup screen. The password can have a maximum of 15 digits (from 84 alphanumeric and symbol characters). By joint use with the Select Menu, it is possible to distinguish between operator and administrator use

Collective moving of inspection areas

This function is essential to simultaneously move multiple inspection areas for the purpose of fine adjustment of the target position. The areas can be chosen by camera, position correction group, or inspection checker

O PVWIN200 setup software

User-friendly drag-and-drop operations

Drag the target image and drop it onto a PVWIN200 screen to start the operation. The guidance by the navigation view icons will help you set the inspection conditions.

Download PVWIN for free from our website.

Checker list

IMAGECHECKER

The checker list shows the on/off state of each inspection function and the inspection results so that users can check the program outline. It is possible to jump to the setting screen for a selected function and edit the settings

Histogram

In the image preprocessing and the binarization setting screens, both the original image and its histogram are displayed as guidance for processing

After processing Before processing

Setting help

Various functions are built in that are useful when installing the PV200 series at the worksite.

Simulation cycle for debugging

The continuous simulation and data logging functions facilitate setting data corrections and verifications. The export function allows you to manage the setting data change history.

PV200 setup software IMAGECHECKER 7win200

Interface

PLC communication

By simply setting the register address of the PLC or other equipment you are using with the device, it is possible to receive PV200 series results and perform command operations.

Result output

By using the PLC communications function, the PV200 series results can be written directly to the PLC register without a communications program.

Command processing

PV200 external command control is possible by operating the PLC register values without a communications program.

High-speed communications and storage (Built-in memory / Ethernet / SD memory card)

Inspection and judgement result data output

■ Compatible with parallel I/O, RS-232C (115.2 kbps), Ethernet (Gigabit). The RS-232C PLC communications are now compatible with Modbus RTU.

Image data

- Up to 312 images captured by the 0.3M camera, 39 images captured by the 2M camera and 14 images captured by the 4M camera can be stored in the built-in memory in real time (without increasing the processing time).*1
- A 32 GB SD memory card can store a maximum of about 90,000 images captured by the 0.3M camera, about 16,500 images captured by the 2M camera or about 7,600 images captured by 4M camera. *2
- The Gigabit Ethernet LAN port allows image transfers at three to five times the speed of 100-Megabit Ethernet. Via this port, one image captured by the 0.3M camera can be transferred in 80 ms.*3

- *1: When one camera is connected. *2: Color camera images: Bayer format

Multiple simultaneous output to external devices.

Judgement results and numerical result data can be simultaneously output to RS-232C and Ethernet interfaces, and to SD/SDHC memory cards. For example, the data for traceability and inspection control can be simultaneously output.

- 1. General use results can be simultaneously output to an SD memory card, RS-232C and Ethernet interfaces.
- 2. Ethernet can be used at the same time for output of general use results and PLC communications.
- *4: The free software "Image Receiver for PV" is used.

IMAGECHECKER PV230

Model with code reading and optical character recognition functions built into PV200

Solutions for Optical Character Recognition (OCR) and 1D / 2D Code Reading (CR)

All-in-one model featuring image processing, optical character recognition (OCR) and code reading (CR) functions

- Compatible with a wide variety of cameras ranging from 0.3M to 4M pixels Reliable character extraction achieved by the color / gray combination function
- The optical character recognition (OCR) can read up to 80 characters. [Capable of case-sensitive (capital letter or small letters) reading]
- The 1D / 2D code reading function is compatible with the following code types and can read up to 80 characters.
 - 1D code: 25 types (Industrial 2 of 5, EAN-13, Code 39, etc. *1) 2D code: 2 types (Data Matrix ECC 200, QR Code)
- Capable of checking the 1D / 2D code reading result with that of reading the character string indicated with the code
- Equipped with a function to check the 2D code print quality (Compliant with ISO / IEC 15415)
- Capable of combination inspections using a variety of checker functions of PV200 (Smart edge, etc.)
- The PLC communications function enables communications with PLC without programming (Ethernet and RS-232C).
- Compatible with setup software (PVWIN230), which enables off-line operation

O A wide variety of Preprocessing filters, Color extraction and Gray conversion functions provide reliable reading

Reliably extracting only characters of selected colors even if the contrast with the background is low (Characters of up to 8 colors can be extracted simultaneously.)

RSTUVWX

Capable of reliably reading deformed, distorted or partly chipped characters Arc-shaped character strings, italic and dotted characters can be read.

2D code reading: Codes with contrast fluctuations, out-of-focus codes, and codes with hidden or chipped portions can also be read.

*1: Readable 1D codes (all the 25 types): Industrial 2 of 5, Interleaved 2 of 5, Codabar, Code39, Code93, Code128, EAN-13, EAN-13 Add-On 2, EAN-13 Add-On 5, EAN-8, EAN-8 Add-On 2, EAN-8 Add-On 5, UPC-A, UPC-A Add-On 2, UPC-A Add-On 5, UPC-E, UPC-E Add-On 2, UPC-E Add-On 5, PharmaCode, RSS-14 (GS1 Databar), RSS-14 Truncated (GS1 Databar Truncated), RSS-14 Stacked (GS1 Databar Stacked), RSS-14 Stacked Omnidirectional (GS1 Databar Stacked Omnidirectional), RSS Limited (GS1 Databar Limited), RSS Expanded (GS1 Databar Expanded)

IMAGECHECKER PV240

built into PV200

Suggestion of Machine Vision System for Alignment

Suggestion 1 Auto calibration function

Suggestion 2 Calibration graphics

Suggestion 3 Alignment simulation function [setup software]

Suggestion 4 Sample setting data

• Auto calibration function

The alignment mark is captured and the coordinates of the camera and stage are automatically calibrated.

[Setting procedure]

Using auto calibration function *The coordinates of camera and stage are automatically calibrated.

Calibration complete

• The difference in two camera views and flexible camera attachment (rotation and tilt) also supported.

• Calibration graphics Camera 0

Auto calibration result can be verified visually.

Easy to verify whether or not calibration was performed accurately, one of the factors for alignment problems.

Auto calibration result: Lateral place relationship

Auto calibration result: Vertical placement different from actual positional relationship

• Alignment simulation function [setup software] *Setup software can be downloaded from our website.

Alignment operation can be replicated on a PC.

The operation can be verified in stages through simulation that splits the alignment operation into 4 steps.

No troublesome settings and calculations!

- In the event of a problem, as long as you have an image, you can use the setup software to check the alignment operation at your desk. This is convenient for determining the location of the source of the problem.
- By being able to check the output values, you can tell whether the problem is caused by image processing or whether it originates in the device.

Sample setting data

Sample setting data saved with basic alignment conditions is available. Default settings are easily created by changing conditions such as the marks used by the user.

* Sample setting data can be downloaded from our

Application examples of PV240 Applying LCD and film

IMAGECHECKER PV260

Robot setup made totally simple! Introducing true robot vision

functions reduce robot setup time.

Auto calibration function

Man-hour reduction

Accuracy improvement

By simply registering 3 or 4 capture coordinates with the PV260, you can easily convert the camera's coordinate system to the robot's coordinate system

Advantage

- Easier than doing it manually, work time is also reduced.
- 2 Even camera positional deviation can be quickly restored.
- 3 Variance in accuracy due to individual differences is eliminated.

戌 Robot tool offset function

Man-hour reduction

Accuracy improvement

By simply registering two coordinates for the tool installed on the robot, the tool's coordinate system can be automatically calculated and converted to the robot's coordinate system.

Teaching support function

Man-hour reduction

Accuracy improvement

Improving on previous teaching operations that were carried out while manipulating a dedicated robot pendant, robot teaching can now be done on the PV260 setup screen while viewing the captured image. Intuitive teaching can now be achieved using keypad operation.

Direct communication function

Man-hour reduction

Direct communication is possible with different manufacturer's robot. PLC programming time can be reduced, because communication can be achieved by simply selecting the robot maker

Robot can be operated from keypad.

Robot can be moved using keypad operation. Adjustment of capture position is easy with features such as auto calibration and teaching support.

PVWIN260 setup software

Robot vision inspection result can be replicated

The continuous simulation and data logging functions facilitate setting data creation corrections and verifications.

Specifications

General specifications

	Specifications
Rated operating voltage	24 V DC
Operating voltage range	21.6 to 26.4 V DC (including ripples)
Rated current consumption	1.2 A max.
Ambient temperature during use	0 to +45 °C 32 to +113 °F (However, no condensation or no freezing)
Storage ambient temperature	-20 to +60 °C -4 to +140 °F (However, no condensation or no freezing)
Ambient humidity during use	35 to 85 % RH (at 25 °C 77 °F, However, no condensation or no freezing)
Storage ambient humidity	35 to 85 % RH (at 25 °C 77 °F, However, no condensation or no freezing)
Noise immunity	1,000 V, Pulse width: 50 ns, 1 µs (using the noise simulator method)
Vibration resistance	10 to 55 Hz, 1 sweep/min, double amplitude of 0.75 mm 0.03 in, 30 minutes each in the X, Y, and Z directions
Shock resistance	196 m/s², 5 times each in the X, Y and Z directions
	100 MΩ or higher (measured by a 500 V DC megger) *1
Insulation resistance	Input and output terminals Power and ground terminals
(initial value)	Input and output terminals Non-energized metal part
	Power terminal Non-energized metal part
	500 V AC for 1 min (600 V AC for 1 sec), Cutoff current: 10 mA *1
Breakdown voltage	Input and output terminals Power and ground terminals
(initial value)	Input and output terminals Non-energized metal part
	Power terminal Non-energized metal part
Battery life	10 years approx. (at 25 °C 77 °F)
Weight	0.5 kg approx. (including terminal blocks)
Pollution degree	2

^{*1:} The evaluation was carried out with the primary side power supply varistor and capacitor removed from the internal circuit of the unit.

Specifications for PV200 firmware Ver. 1.5 or later.

*2: The 4M grey camera cannot be used in combination with another type of camera.

The ANPVC82— dedicated compact camera cable is required to connect the compact cameras.

*3: USB cannot be used for the external input/output functions.

*4: Image and screenshot output functions via Ethernet are received by dedicated software, Image Receiver.
